

Paediatrics Nursing Quiz (40 Questions)

Please select the best option for each question. The correct answers have been removed for your self-assessment.

Question 1

A new mother is informed that macrophages and neutrophils are present in her breast milk. What is the primary function of these white blood cells?

- a. To facilitate digestion in the baby
- b. To surround and destroy bacteria through phagocytosis
- c. To enhance the flavour of the milk
- d. To provide energy to the baby

Question 2

A mother is concerned about her baby's hydration in hot weather. What advice should the healthcare provider give regarding water for breastfeeding infants?

- a. Only give water if the baby seems hungry.
- b. Offer water frequently to prevent dehydration.
- c. Water is necessary for all infants, regardless of breastfeeding.
- d. It is important not to give water; breast milk provides adequate hydration.

Question 3

Why is it important for mothers who intend to breastfeed to receive special instructions on nipple and breast care?

- a. To enhance the aesthetic appearance of the breasts
- b. To reduce the frequency of breastfeeding
- c. To prevent discomfort and complications such as cracked nipples
- d. To encourage faster weaning

Question 4

A mother is concerned about her baby's hydration in hot weather. What advice should the healthcare provider give regarding water for breastfeeding infants?

- a. Length of gestation
- b. Maternal age
- c. Preterm birth
- d. Hereditary factors

Question 5

Which type of milk is rich in proteins and immunoglobulins and is produced after birth?

- a. Colostrum
- b. Transitional milk

- c. Foremilk**
- d. Mature milk**

Question 6

Which type of formula might be recommended for infants with specific medical or dietary needs?

- a. Soy-based formula**
- b. Homemade formula**
- c. Cow's milk-based formula**
- d. Specialized commercial infant formula**

Question 7

A mother expresses concern that her breast milk does not seem rich enough for her newborn. How can the nurse reassure her about the importance of colostrum in the early days after birth?

- a. Colostrum provides sufficient energy for the first six months.**
- b. Colostrum is essential for building the newborn's immune system.**
- c. Colostrum is not as important as mature milk.**
- d. Colostrum is primarily composed of carbohydrates.**

Question 8

A mother is informed that her colostrum is transitioning to transitional milk by day 3 postpartum. Which of the following changes in breast milk should she expect during this period?

- a. No change in colour or appearance**
- b. A complete loss of nutrients**
- c. Decreased volume and consistency**
- d. Increasing amounts of fat and lactose**

Question 9

A mother is curious about how her diet affects her breast milk. What explanation should she receive regarding the colour of her breast milk?

- a. The colour indicates the baby's health.**
- b. It can vary based on the mother's diet and the time of day.**
- c. The colour does not change based on diet.**
- d. It should always be white regardless of her food choices.**

Question 10

Why is it important to have an accurate scale, such as a beam balance or Salter spring, when weighing a newborn?

- a. To distract the caregiver**

- b. To ensure comfort for the infant**
- c. To promote visual interest**
- d. To provide accurate and reliable weight measurements**

Question 11

Why is early initiation of breastfeeding (within the first hour of birth) important?

- a. It protects the newborn from infections and reduces mortality.**
- b. It allows the mother to rest before feeding.**
- c. It promotes quicker weaning.**
- d. It helps the newborn bond with the father.**

Question 12

A nurse assesses a 10-year-old boy with stunted growth. His parents are of average height. Which factor should the nurse consider as a likely cause of his short stature?

- a. Chronic illness**
- b. Male sex**
- c. Parental genetics**
- d. Increased physical activity**

Question 13

Why is it important to provide privacy during the weighing of the infant?

- a. To prevent the mother from asking questions**
- b. To enhance the accuracy of the weight measurement**
- c. To minimize distractions from other patients**
- d. To allow the mother and child to bond without feeling observed**

Question 14

A mother observes that her breast milk is now creamier compared to when she first started breastfeeding. What does this change indicate about her milk?

- a. It indicates an infection in the breast.**
- b. It is unhealthy and should be discarded.**
- c. It is transitioning from colostrum to mature milk.**
- d. It means the baby is not receiving enough nutrients.**

Question 15

A mother expresses concern that her milk seems too watery compared to when she was breastfeeding initially. What should the nurse explain regarding this observation?

- a. It means she should stop breastfeeding immediately.**
- b. It indicates that her milk is low in nutrients.**
- c. It is a sign of dehydration in the baby.**

d. It reflects the normal consistency of mature milk, which is thinner than colostrum.

Question 16

A mother is concerned that her 1-year-old baby's weight has not tripled since birth. If the baby's birth weight was 3.0 kg, what would the expected weight be at 12 months for normal growth?

- a. 7.5 kg**
- b. 12.0 kg**
- c. 6.0 kg**
- d. 9.0 kg**

Question 17

Which of the following is a true statement about the growth process?

- a. Growth stops at the age of 10**
- b. There are no critical stages in growth and development**
- c. Growth and development only occur during childhood**
- d. Development continues after the initial growth phases**

Question 18

A mother asks how height is related to her child's health. What would be the nurse's best explanation?

- a. Height is primarily determined by genetics and does not relate to health concerns.**
- b. Stunting is common and should not cause any health concerns.**
- c. Height alone is not significant, only weight matters for growth.**
- d. Height can reflect nutritional status, and if the child is stunted, it may indicate malnutrition.**

Question 19

Which statement is true regarding the sequence of growth and development?

- a. The sequence is predictable, but timing varies individually**
- b. The effects of each stage are identical for everyone**
- c. All humans follow the same timeline for each stage**
- d. Growth and development are not influenced by genetics**

Question 20

Which of the following statements is true about formula feeding?

- a. Formula should only be used as a supplement to breastfeeding when necessary.**
- b. Infants can only thrive on homemade formula.**
- c. Formula feeding provides the same immunological benefits as breastfeeding.**
- d. Formula feeding eliminates the need for regular paediatric check-ups.**

Question 21

Which statement about mature milk is accurate?

- a. It is produced only during the first week postpartum**
- b. It contains a stable composition of nutrients that support growth**
- c. It provides no immune factors**
- d. It has lower fat content than colostrum**

Question 22

Why is early initiation of breastfeeding within one hour of birth crucial?

- a. It helps in weight gain**
- b. It promotes faster growth**
- c. It makes breastfeeding easier later on**
- d. It protects the newborn from infections and reduces mortality**

Question 23

Which physical change is often one of the first signs of puberty in boys?

- a. Voice change**
- b. Facial hair growth**
- c. Growth spurt**
- d. Testicular enlargement**

Question 24

Which of the following is a quantitative indicator of physiological growth?

- a. Bone size**
- b. Emotional development**
- c. Cognitive abilities**
- d. Language acquisition**

Question 25

A mother asks about the growth factors in colostrum. What do these growth factors primarily stimulate in the newborn?

- a. Immune system function**
- b. Immature intestines to grow, digest, and absorb milk**
- c. Cognitive development**
- d. Muscle development**

Question 26

Why do infants require a higher intake of calories, minerals, vitamins, and fluids compared to older children?

- a. They do not require any dietary nutrients during the first year.**
- b. Their metabolic rate is lower than that of older children.**
- c. They have a larger body surface area relative to their weight and height.**

d. Their digestive systems are less efficient than older children's.

Question 27

A mother notices her baby has hiccups after feeding. What is the recommended course of action according to breastfeeding guidelines?

- a. Express breast milk and give it to the baby.**
- b. Wait for the hiccups to go away naturally.**
- c. Switch to formula feeding immediately.**
- d. Burp the baby vigorously.**

Question 28

A mother is concerned that her daughter is shorter than her peers. Which explanation would the nurse give regarding sex differences in height?

- a. Girls typically grow faster during infancy but may slow down during childhood.**
- b. Girls tend to experience slower growth compared to boys throughout childhood.**
- c. Boys and girls grow at the same rate until puberty when boys experience a growth spurt.**
- d. Girls are always shorter than boys during childhood.**

Question 29

A mother learns about the transition from colostrum to mature milk. What is a critical point the healthcare provider should make regarding this transition?

- a. Mature milk is produced within two weeks postpartum.**
- b. The composition of colostrum does not change over time.**
- c. Transitional milk is more nutritious than colostrum.**
- d. Colostrum becomes obsolete after the first week.**

Question 30

Which portion of the body experiences the fastest growth during fetal life?

- a. Lower limbs**
- b. Arms**
- c. Trunk**
- d. Head**

Question 31

A nurse discusses the benefits of breastfeeding with a new parent. How does breastfeeding promote emotional development in the baby?

- a. It allows for physical closeness and bonding with the mother.**
- b. It creates a routine that the baby enjoys.**
- c. It helps the baby learn to self-soothe.**
- d. It makes the baby more independent.**

Question 32

A nurse is assessing a child who has been frequently ill over the past year. How might chronic illness impact the child's height?

- a. Chronic illness can stunt growth, leading to shorter adult height if untreated.**
- b. It may temporarily delay growth but won't affect the final adult height.**
- c. Illness has no impact on height; it only affects weight.**
- d. Growth can always catch up once the illness is treated.**

Question 33

Why is it important to record the weight in a weighing book immediately after weighing the infant?

- a. To prevent the infant from crying**
- b. To ensure accurate data for future reference and monitoring**
- c. To make the process quicker**
- d. To inform other staff about the infant's health**

Question 34

Which physiological factor contributes to younger children losing relatively more fluids compared to older children?

- a. Higher metabolic rate**
- b. Greater fluid retention in tissues**
- c. Immature renal function**
- d. Increased physical activity**

Question 35

A mother is worried about her 3-month-old baby's growth and feeding habits. What advice should a healthcare provider offer regarding growth monitoring?

- a. Reassure the mother that growth is not a concern until later ages**
- b. Focus solely on the baby's feeding schedule**
- c. Suggest stopping breastfeeding to manage weight**
- d. Regularly track the baby's weight and length while ensuring adequate feeding**

Question 36

A nurse is assessing a mother who has just given birth. Which observation about colostrum should the nurse explain to the mother regarding its colour and texture?

- a. It is thick and white.**
- b. It is red and creamy.**
- c. It is clear and watery.**
- d. It is yellowish and watery.**

Question 37

Which of the following statements is true regarding the timing of breast development and menstruation in girls?

- a. Breast development always precedes menstruation**
- b. Breast development usually occurs before menstruation, but not always**
- c. Menstruation occurs before breast development**
- d. Breast development and menstruation occur simultaneously**

Question 38

Why is it important to recognize the interrelation between growth and development in infants?

- a. All of the above.**
- b. It allows caregivers to plan nutrition and health interventions effectively.**
- c. It aids in understanding how environmental factors influence physical changes.**
- d. It helps in predicting future growth patterns.**

Question 39

Why is breast milk particularly important during illness for malnourished children?

- a. It prevents weight loss**
- b. It serves as a critical source of energy and nutrients**
- c. It substitutes for medical treatment**
- d. It enhances flavour preferences**

Question 40

A nurse is assessing a newborn's weight gain. Which maternal factor would most likely influence postnatal weight gain in a full-term baby?

- a. Length of gestation**
- b. Maternal age of 28 years**
- c. Full-term birth**
- d. Maternal age of 40 years**
