

- 119) In the peptidoglycan structure, which amino acid is often used to replace meso-diaminopimelic acid in certain bacteria?
- A. L-lysine
 - B. D-alanine
 - C. N-acetylglucosamine
 - D. N-acetylmuramic acid
- 120) Peptidoglycan is best described as:
- A. A simple sugar polymer
 - B. A lipid-based molecule
 - C. A mesh-like polymer composed of sugars and amino acids
 - D. A single chain of N-acetylglucosamine molecules
