

c. Crepitus

d. Fremitus

Correct answer: d. Fremitus

Rationale:

Palpable vibrations during speech = tactile fremitus.

Question 43

During percussion of the lungs, a sound that is louder, lower, and longer than resonance would be

Documented as:

a. Dullness

b. Tympany

c. Flatness

d. Hyper-resonance

Correct answer: d. Hyper-resonance

Rationale:

Louder, lower, longer than resonance = hyper-resonance.

Question 44

All the following are considered important environmental factors to ask about in a respiratory health

History EXCEPT:

- a. Exposure to secondhand smoke in the home
- b. Hobbies such as woodworking or painting
- c. The type of heating and air conditioning system in the home
- d. The patient's favorite type of physical exercise

Correct answer: d. Favorite type of physical exercise

Rationale:

Exercise preference is not an environmental respiratory risk.

Question 45

While assessing a patient's skin, the nurse asked, "Does anyone else in your family have a similar rash?"

What does this question seek to uncover? To:

- a. Evaluate the client's household living patterns for potential triggers.
- b. Determine if the client may be using shared personal care products.
- c. Assess the client's social support system in relation to symptoms.
- d. Help determine if the rash is contagious or has a genetic component.

Correct answer: d. Determine if contagious or genetic

Rationale:

Family history helps assess infectious or hereditary causes.

Question 46

During the physical examination of the abdomen, what is the correct sequence of techniques?

- a. Inspection, Percussion, Palpation, Auscultation
- b. Inspection, Auscultation, Percussion, Palpation
- c. Inspection, Auscultation, Palpation, Percussion
- d. Inspection, Palpation, Percussion, Auscultation

Correct answer: b. Inspection, Auscultation, Percussion, Palpation

Rationale:

Auscultation comes before palpation to avoid altering bowel sounds.

Question 47

Which statement BEST explains why bowel pattern changes must be compared with a client's usual habits?

- a. Most people are expected to pass one stool every day
- b. Normal bowel frequency varies widely among individuals
- c. Any form of constipation usually signals a bowel blockage. Daily food intake usually predicts stool frequency precisely

Correct answer: b. Normal bowel frequency varies widely

Rationale:

"Normal" bowel habits differ among individuals.

Question 48

Which of the following BEST explains the role of ongoing/partial assessment? It:

- a. Replaces the initial assessment when patients stabilize
- b. Focuses only on new hospital-acquired problems

- c. Evaluates only medication side effects
- d. Monitors changes in previously identified problems

Correct answer: d. Monitors changes in previously identified problems

Rationale:

Ongoing assessment tracks progress or deterioration.

Question 49

When evaluating information provided by a secondary informant, the nurse's priority will be to:

- a. Validate reliability of the information before use
- b. Document but avoid using it in planning
- c. Accept the data because patient is unconscious
- d. Rely more on physical findings

Correct answer: a. Validate reliability before use

Rationale:

Secondary data must be verified.

Question 50

What is the primary reason for the change in the sequence for abdominal assessment?

- a. Make the examination more efficient overall
- b. Follow a structured regional sequence
- c. Ensure comfort by using gentle techniques
- d. Avoid altering the pattern of bowel sounds

Correct answer: d. Avoid altering bowel sounds

Rationale:

Palpation may stimulate peristalsis, altering findings.

Question 51

Which of the following BEST defines orthopnea?

- a. An uncomfortable awareness of breathing inappropriate to exertion.
- b. Dyspnea that occurs when lying down and improves when sitting up.c. Episodes of sudden dyspnea that awaken the patient from sleep.
- c. Swelling in the extremities due to fluid overload.

Correct answer: b. Dyspnea when lying down

Rationale:

Classic definition of orthopnea.

Question 52

Asking about recent diet changes when assessing hair problems is important because:

- a. Hair texture can shift slightly in response to certain lifestyle habits.
- b. Clients may report eating patterns that vary with their symptoms.
- c. Nutritional deficiencies can manifest as changes in hair appearance.
- d. It helps determine whether referral for dietary guidance is appropriate.

Correct answer: c. Nutritional deficiencies affect hair

Rationale:

Hair changes reflect protein, iron, and vitamin deficiencies.

Question 53

If a client has black-colored stools, the nurse should understand that this could indicate:

- a. A diet that is rich in green leafy vegetables daily

- b. A reduced amount of normal bile pigment present
- c. Gastrointestinal bleeding or iron supplement intake
- d. The presence of painful external hemorrhoids only

Correct answer: c. GI bleeding or iron intake

Rationale:

Black stools = melena or iron supplements.

Question 54

The nurse evaluates the following findings in a patient: use of accessory muscles, tracheal deviation to the

Right, and absent breath sounds on the left. What is the priority nursing action?

- a. Administer a prescribed bronchodilator.
- b. Prepare for emergency needle decompression.
- c. Document the findings as chronic COPD.
- d. Encourage deep breathing and coughing exercises.

Correct answer: b. Prepare for emergency needle decompression

Rationale:

Signs indicate tension pneumothorax, a life-threatening emergency.

Question 55

The rationale for listening at the aortic area (2nd right ICS) is that:

- a. It is directly over the left ventricle.
- b. The ascending aorta lies closest to this site.
- c. The tricuspid valve sounds are best conducted here.
- d. It is the best location to hear S3 and S4 gallops.

Correct answer: b. Ascending aorta lies closest

Rationale:

Aortic valve sounds are best heard where the aorta is nearest.

Question 56

When comparing the assessment findings of a patient with emphysema and a patient with a large pleura effusion, which combination would the nurse expect to be different?

- a. Emphysema: Wheezes; Pleural Effusion: Rhonchi

- b. Emphysema: Barrel chest; Pleural Effusion: Pectus excavatum
- c. Emphysema: Decreased fremitus; Pleural Effusion: Decreased fremitus
- d. Emphysema: Hyper-resonance; Pleural Effusion: Dullness

Correct answer: d. Hyper-resonance vs dullness

Rationale:

Emphysema = air → hyper-resonance

Effusion = fluid → dullness

Question 57

All the following are components of a comprehensive adult health history EXCEPT:

- a. Patient profile and lifestyle
- b. Nursing interventions
- c. Review of systems
- d. Family health history

Correct answer: b. Nursing interventions

Rationale:

Interventions are part of care planning, not history.

Question 58

A client with a history of recent abdominal surgery has hypoactive bowel sounds in all quadrants. The nurse analyzes that this is MOST likely due to:

- a. Preoperative fasting
- b. Gastroenteritis
- c. Paralytic ileus
- d. Early bowel obstruction

Correct answer: c. Paralytic ileus

Rationale:

Post-surgery hypoactive sounds = temporary bowel paralysis.

Question 59

A patient with suspected cardiac disorder presented with bilateral edema in the extremities. Which of the

Following BEST explains this observation?

- a. Fluid overload from heart failure
- b. Thrombophlebitis
- c. Surgical removal of lymph channels
- d. Venous insufficiency from varicosities

Correct answer: a. Fluid overload from heart failure

Rationale:

Bilateral edema suggests systemic fluid retention.

Question 60

A client reports a decrease in hair growth on their lower legs. Which of the following could be the cause of

This problem?

- a. Nerve sensation
- b. Venous circulation
- c. Arterial circulation

- d. Lymphatic drainage

Correct answer: c. Arterial circulation

Rationale:

Reduced hair growth reflects poor arterial blood supply.

Question 61

A patient with severe, unilateral pneumonia would MOST likely demonstrate:

- a. Increased diaphragmatic excursion on the lung showing marked consolidation.
- b. Asymmetrical chest expansion with reduced movement on the affected side.
- c. Hyper-resonant percussion findings over the region of dense consolidation.
- d. Bilateral chest expansion with movement that appears generally uniform.

Correct answer: b. Asymmetrical chest expansion

Rationale:

Unilateral pneumonia limits movement on affected side.

Question 62

Which of the following MOST describes tactile fremitus?

- a. The assessment of tenderness and sensation by palpating the posterior thorax.
- b. The visual observation of the chest wall expanding symmetrically during inspiration.
- c. The audible sound produced by percussing the chest wall while the patient is speaking
- d. The palpable vibrations transmitted through the bronchopulmonary tree to the chest wall as the patient speaks.

Correct answer: d. Palpable vibrations during speech

Rationale:

Exact definition of tactile fremitus.

Question 63

Which of the following causes Vitiligo?

- a. An autoimmune destruction of melanocytes
- b. A nutritional deficiency
- c. An uneven distribution of melanin
- d. A contagious fungal infection
