

Correct answer: a. Autoimmune destruction of melanocytes

Rationale:

Vitiligo is an autoimmune condition.

Question 64

A client reports a “heavy, dragging feeling” in his scrotum. The nurse understands this is MOST associated with which condition?

- a. Urinary tract infection
- b. Benign prostatic hypertrophy
- c. Testicular tumor or scrotal hernia
- d. Sexually transmitted infection

Correct answer: c. Testicular tumor or scrotal hernia

Rationale:

Heavy dragging sensation is classic for hernia or tumor.

Question 65

When analyzing the cause of a client’s abdominal pain, the nurse distinguishes that pain which is “sharp, precisely localized, and aggravated by movement” is characteristic of:

- a. Psychosomatic pain from stress
- b. Parietal pain from peritoneal inflammation
- c. Referred pain from another site
- d. Visceral pain from an internal organ

Correct answer: b. Parietal pain

Rationale:

Sharp, localized, movement-aggravated pain = parietal.

Question 66

A client's abdominal percussion notes tympany in all quadrants except for a large area of dullness in the

Right upper quadrant that is enlarged downward. The nurse analyzes this finding as MOST indicative of:

- a. Splenic enlargement
- b. Hepatomegaly
- c. A normal liver span
- d. A distended bladder
- e. A normal liver span

Correct answer: b. Hepatomegaly

Rationale:

Enlarged RUQ dullness indicates enlarged liver.

Question 67

The sound of a bruit is BEST heard with the diaphragm of the stethoscope because:

- a. Bruits are typically high-pitched.
- b. The diaphragm amplifies low-frequency tracheal sounds.
- c. The diaphragm is better for low-pitched sounds like S3.
- d. The bell is too large to fit on the neck properly.

Correct answer: a. Bruits are high-pitched

Rationale:

High-frequency sounds require the diaphragm.

Question 68

A history of problems with wound healing can point to all the following EXCEPT:

- a. Nutritional or metabolic problems affecting tissue repair

- b. Underlying systemic disease influencing immune response
- c. Infection or poor circulation limiting adequate perfusion
- d. The client's level of physical activity during daily routines

Correct answer: d. Physical activity level

Rationale:

Activity level is not a primary cause of poor wound healing.

Question 69

Which finding BEST differentiates objective data from subjective data?

- a. Nurse observes crying vs. Patient reports sadness
- b. Family states patient is confused vs. Patient denies confusion
- c. Client reports difficulty breathing vs. SpO₂ of 88%
- d. Client says pain is severe vs. Pain medication ordered

Correct answer: c. Dyspnea report vs SpO₂ 88%

Rationale:

SpO₂ is objective, breathing difficulty is subjective.

Question 70

The finding of “bibasilar crackles” is MOST classically associated with:

- a. Localized pneumonia
- b. Asthma
- c. Pneumothorax
- d. Heart Failure

Correct answer: d. Heart Failure

Rationale:

Bibasilar crackles = pulmonary edema from heart failure.

Question 71

When percussing the chest of a patient, the nurse notes a hyper-resonant tone. This finding is MOST

Consistent with which of the following?

- a. Lobar pneumonia, where fluid replaces air in the lung.
- b. Emphysema, where air is trapped in the lung tissues.

- c. Atelectasis, where the lung tissue is collapsed.
- d. A pleural effusion, where fluid occupies the pleural space.

Correct answer: b. Emphysema

Rationale:

Hyper-resonance indicates excess air trapping.

Question 72

A client with poor sphincter tone during a digital rectal exam might have a history of all the following

EXCEPT:

- a. High levels of anxiety
- b. Prolapsed rectum
- c. Previous rectal surgery
- d. Spinal cord injury

Correct answer: a. High anxiety

Rationale:

Anxiety does not reduce sphincter tone.

Question 73

A patient is admitted to the hospital with left upper quadrant (LUQ) pain. Which of the following organs

May be the source of the pain?

- a. Gallbladder
- b. Liver
- c. Spleen
- d. Appendix

Correct answer: c. Spleen

Rationale:

LUQ organs include spleen, stomach, pancreas.

Question 74

The nurse is percussing a client's abdomen and hears a large area of dullness in the upper abdomen. This finding could be consistent with all the following EXCEPT:

- a. A gastric dilation
- b. A gas-filled stomach
- c. An enlarged liver
- d. A pancreatic mass

Correct answer: b. Gas-filled stomach

Rationale:

Gas causes tympany, not dullness.

Question 75

All the following as potential causes for an enlarged scrotum EXCEPT:

- a. Hydrocele
- b. Prostatitis
- c. Hernia
- d. Hematocele

Correct answer: b. Prostatitis

Rationale:

Prostatitis does not enlarge the scrotum.

Question 76

What is the recommended minimum time to listen for bowel sounds in one quadrant before concluding

They are absent?

- a. 1 minute
- b. 5 minutes
- c. 10 minutes
- d. 3 minutes

Correct answer: b. 5 minutes

Rationale:

You must listen up to 5 minutes before declaring bowel sounds absent.

Question 77

If a patient has a pleural effusion in the right lung, which combination of findings is MOST likely during

Assessment? a. Increased chest expansion and hyper-resonant percussion on the right.

b. Decreased tactile fremitus and dull percussion on the right.

d. Wheezes and symmetrical air entry bilaterally.

e. Increased tactile fremitus and resonant percussion on the right.

Correct answer: b. Decreased fremitus + dullness

Rationale:

Pleural effusion blocks vibration and adds fluid → dull percussion.

Question 78

While taking a health history, a client reports vomiting with blood. Which of the following conditions is

Associated with this symptom?

a. Lactase deficiency and bloating

b. Esophageal varices or duodenal ulcers

c. Food intolerances and irritable bowel

d. Inflammatory bowel diseases like Crohn's

Correct answer: b. Esophageal varices or duodenal ulcers

Rationale:

Vomiting blood = hematemesis.

Question 79

All the following structures are listed as components of the mediastinum EXCEPT:

- a. Esophagus
- b. Trachea
- c. Lungs
- d. Heart

Correct answer: c. Lungs

Rationale:

Lungs are outside the mediastinum.

Question 80

Abdominal pain that is sharp, precisely localized, and worsened by movement is described as:

- a. Parietal pain

b. Functional pain

c. Referred pain

d. Visceral pain

Correct answer: a. Parietal pain

Rationale:

Sharp, localized, worsened by movement = parietal pain.
